

Exchange Server

Enterprise e-mail without the worry

Microsoft Exchange Server is the leading enterprise mail and calendaring solution available today. It's also significantly more complex than legacy mail systems, which can lead to problems in the event that it is setup incorrectly. For this reason, Enfold IT now provides Exchange as a managed application to small and medium businesses.

Our Exchange servers come as a "black box" implementations that joins your existing network or can be hosted off-site in our data center. The system is setup and configured for your domain(s) and monitored for emerging issues. We perform all required maintenance and backup procedures as are recommended by Microsoft. In addition, our 24/7/365 monitoring system watches for issues and keeps tabs on performance data.

Enfold IT can also supply all licenses and hardware at an affordable monthly rate so you don't have to spend thousands up front to get started.

We have system configurations that include:

- All versions from 2000 to the current
- Clustering: Uses several machines in the event of a local machine failure
- Available off-site replication via Neverfail
- Remote and on-site backup available to a variety of media

All accounts provided by Enfold IT include Outlook and web access to e-mail, as well as MAPI access by compatible clients. We can provide upgrades for Blackberry[®] access as an additional item.
